

Centuries before our modern devices, there were kitchens lined with drying bundles of thyme and yarrow. Rosemary crushed by a woman's bare finger, ears of olive oil infused with basil and oregano. A woman who would have roamed the fields just past, which yielded to sleep for a restless mind, and a single leaf to chew in early spring to wake the liver from winter's sleep."

— MARY BETH ARTHUR in *The Art of the Apothecary*.

A connected agricultural supply chain, built for the real world.

EDITOR'S NOTE

Trade should move at the speed of the harvest

HarvestFlow is building the rails for real-world trade: one ecosystem connecting farmers, fleets, buyers, and agricultural suppliers.

The problem is not a lack of effort. It is a fragmented chain. Produce is graded in one place, transport is arranged somewhere else, payment is chased later, and the record of a successful trade rarely follows the people who earned it.

HarvestFlow brings those steps into one escrow-secured, offline-first flow. Lots can be aggregated, graded, matched, moved, verified, and settled with a shared record that each participant can understand.

This issue follows that journey from the first listed lot to the final proof of delivery. It is a practical view of a supply chain designed around the people who keep it moving.

ONE CHAIN

Four
roles. One
record.

THE ISSUE

A practical tour of one connected trade

- 01 Farmers aggregate, grade, and list.
- 02 Fleets match, move, and prove delivery.
- 03 Buyers source verified volume.
- 04 Suppliers reach active producer networks.
- 05 Escrow and ratings connect the handoffs.

Four roles, one continuous flow

HarvestFlow treats agriculture as a connected system, not a set of isolated transactions. Each role sees the information it needs while contributing to one verifiable trade record.

01 **Farmers**

Aggregate harvests, attach quality evidence, and reach buyers directly.

02 **Logistics**

Bid on matched loads and capture proof of pickup and delivery offline.

03 **B2B buyers**

Source verified lots with parcel tracking and audit-ready records.

04 **Suppliers**

Reach active farmer networks and issue tamper-evident digital receipts.

One ledger turns
trade history
into usable
proof.

Built around the harvest

From a single plot to a cooperative-scale harvest, producers need a practical route to market. HarvestFlow supports aggregation, objective quality records, and direct trade without requiring a smartphone or a constant signal.

THE PRINCIPLE

Premium produce should be priced like premium produce.

01

THE FARMER VIEW

Volume, quality, and payout stay visible.

The producer sees what was contributed, how the lot was graded, and how settlement will be divided.

AGGREGATION

Stronger together

Buyer minimums can put larger contracts beyond the reach of an individual producer. Aggregation changes the unit of negotiation.

HarvestFlow gives cooperatives a shared view of collection points, member volumes, lot quality, and payout splits. Producers keep visibility into what they contributed while the group presents verified volume to the market.

The result is not only more produce in one place. It is a clearer agreement: who supplied what, how it was graded, where it is going, and how settlement will be divided.

SHARED VOLUME

One collection point. Transparent member payouts.

Evidence before price

Every lot can be scored against objective inputs before it enters the marketplace. Buyers see the evidence; producers see how the grade connects to the price.

A PRACTICAL QUALITY RECORD

01

Moisture

A recorded input linked to the lot.

02

Weight

Verified quantity for aggregation and fulfilment.

03

Defects

A visible basis for consistent scoring.

04

Evidence

Photos and sensor data attached to the record.

05

Grade

An objective A+ to C result buyers can search.

06

Price

Premium tiers can be priced automatically.

SEARCHABLE EVIDENCE

A+ to C, with the record attached

- Moisture and weight inputs
- Defect record
- Photo and sensor evidence
- Grade buyers can search

Designed for the signal that drops

KEEP TRADING

USSD + SMS

HarvestFlow supports USSD and SMS workflows so listing, bidding, and confirmation can continue when coverage does not. Offline actions queue, reconcile on reconnect, and retain a verifiable receipt chain.

NO SMARTPHONE REQUIRED

The offline case is the real case

Connectivity should not decide who gets to participate in a market. HarvestFlow is designed so critical actions can be captured first and synchronized later.

A signed action, timestamp, or receipt remains part of the same chain when the network returns. Conflicts are reconciled instead of silently merged.

CORE OFFLINE WORKFLOWS

- > List or accept an order through USSD and SMS.
- > Queue updates until a connection returns.
- > Capture pickup and proof of delivery offline.
- > Keep tamper-evident timestamps and receipts.

CAPTURE FIRST

Sync when signal returns

QUEUED ACTIONS

Record now. Sync later.

Work continues. The record catches up.

OFFLINE INTEGRITY

Capture first. Reconcile on reconnect.

The road is part of the product

A verified harvest still needs the right vehicle, a route that respects the cargo, and proof that survives a network gap.

The route, vehicle, temperature record, and delivery evidence become part of the same shipment story.

ROUTE / PROOF / TELEMETRY

LIVE LOAD MATCHING

Move the load with context

Fleet operators and independent drivers can see loads matched to vehicle class and route, then bid with visibility into weight, distance, and payout.

Routing can account for heat exposure and cold-chain requirements, while live telemetry and deviation alerts help keep cargo within specification.

Pickup and delivery evidence can be captured offline, then synchronized into the shared transaction record.

WHAT TRAVELS WITH THE LOAD

- > Vehicle and route match
- > Weight, distance, and payout
- > Temperature telemetry
- > Proof of pickup and delivery

MATCHED LOAD

The job board shows the whole job

- > Vehicle class and route
- > Weight, distance, and payout
- > Cold-chain requirements
- > Pickup and delivery milestones

One market, many participants

The same lot becomes more useful when everyone sees a role-specific view of one shared record.

SHARED INFRASTRUCTURE

Different tools. One trade record.

Each participant sees a workflow built for their role while contributing to the same verifiable chain of events.

Source with proof attached

Procurement teams can search for lots that already match a requested grade and volume. Evidence travels with each listing, reducing the distance between a specification and a confident purchase.

Once a lot moves, parcel tracking, milestone notifications, and delivery confirmation create an end-to-end view of the shipment.

Exports and APIs are designed to support institutional reporting, audit trails, and role-based access.

A BUYER CAN FOLLOW

- > The specification used to find the lot
- > The quality score and attached evidence
- > The shipment's collection and delivery milestones
- > The final confirmation and audit-ready record

BUYER VIEW

Proof travels with the lot

Search the grade and volume you need

Verified volume.

FROM OFFER TO RECORD

**Negotiate in-app.
Close with a
receipt.**

04 / SUPPLIERS

Reach the people already growing

Agricultural suppliers can list seed, fertilizer, equipment, and other inputs directly to verified producer networks already active on the platform.

Structured offers and counter-offers keep negotiation inside the transaction record. When an agreement closes, both parties receive a tamper-evident digital receipt that can feed their financial ledgers.

The aim is a more direct route between practical farm needs and the businesses equipped to meet them.

STRUCTURED TRADE

Offer. Counter. Agree. Record.

Every offer stays visible to both parties, and every completed agreement can produce a tamper-evident digital receipt.

Escrow by default

HarvestFlow's in-app escrow vault is designed to lock funds when a deal is made and release them only after verified delivery and quality confirmation.

That shared rule changes the conversation for both sides. Producers do not have to chase an invoice after a completed delivery, and buyers do not release funds before the agreed evidence is present.

If a dispute occurs, the payment can remain on hold while the transaction record, ratings, and attached evidence are reviewed.

WHAT ESCROW CHANGES

One release rule, understood by both sides

- > Funds lock when the deal is made
- > Evidence stays with the transaction
- > Disputes can hold settlement
- > Verified delivery releases payment

THE RELEASE CONDITION

**Verified delivery
+ confirmed
quality**

Funds move when the evidence is present.

ACCOUNTABILITY

A reputation that follows the work

A mandatory five-star rating protocol gives farmers, drivers, buyers, and suppliers a shared accountability layer after each trade.

The rating sits beside the transaction record rather than apart from it. Delivery evidence, quality confirmation, offers, and receipts give context to the outcome.

Over time, successful transactions form a financial ledger and digital identity. That history can make completed work more visible when a participant needs to demonstrate reliability.

DIGITAL IDENTITY

A ledger built from completed work

Ratings add accountability. Transaction history adds context. Together, they make reliability easier to demonstrate.

From seed to shelf

- 01

LIST
A farmer or cooperative records the lot.
- 02

GRADE
Quality inputs and evidence produce a score.
- 03

MATCH
A buyer finds the volume and specification needed.
- 04

SECURE
Funds are locked in escrow when the deal is made.
- 05

MOVE
A matched fleet carries the lot with proof captured.
- 06

SETTLE
Verified delivery and quality release payment.

SIX CONNECTED STEPS

List. Grade. Match.
Secure. Move. Settle.

A CHAIN OF EVIDENCE

Every handoff adds to the record

- > Lot and quality evidence
- > Buyer specification
- > Escrow commitment
- > Pickup and delivery proof
- > Settlement and rating

ONE CONTINUOUS FLOW

One continuous
record across every
handoff.

A clearer chain starts with a shared record.

HarvestFlow connects farmers, fleets, buyers, and suppliers on one escrow-secured, offline-first platform.
